**TS: Microsoft .NET Framework 3.5, ASP.NET Application
Development Exam**

TYPE:

DEMO

<http://www.examskey.com/70-562.html>

Examskey Microsoft70-562 exam demo product is here for you to test the quality of the product. This Microsoft70-562 demo also ensures that we have this product ready unlike most companies, which arrange the product for you as you order These 70-562 exam questions are prepared by Microsoft subject matter specialists. Hence these are most accurate version of the 70-562 exam questions that you can get in the market.

We also offer bundle discount packages for every Microsoft certification track, so you can buy all related exam questions in one convenient bundle. And for corporate clients we also offer bundles for Microsoft certification exams at huge discount.

Check out our [70-562 Exam Page](#) and [Microsoft Certification Page](#) for more details of these bundle packages.

Question: 1

You have a Microsoft ASP.NET Framework version 1.0 application. The application does not use any features that are deprecated in the Microsoft .NET Framework version 3.5. The application runs on Microsoft IIS 6.0. You need to configure the application to use the ASP.NET Framework version 3.5 without recompiling the application. What should you do?

- A. Edit the ASP.NET runtime version in IIS 6.0.
- B. Edit the System.Web section handler version number in the machine.config file.
- C. Add the requiredRuntime configuration element to the Web.config file and set the version attribute to v3.5.
- D. Add the supportedRuntime configuration element in the Web.config file and set the version attribute to v3.5.

Answer: A

Question: 2

You create a Microsoft ASP.NET Web application by using the Microsoft .NET Framework version 3.5. You plan to set up authentication for the Web application. The application must support users from untrusted domains. You need to ensure that anonymous users cannot access the application. Which code fragment should you add to the Web.config file?

- A.

```
<system.web>
  <authentication mode="Forms">
    <forms loginUrl="login.aspx" />
  </authentication>
  <authorization>
    <deny users="?" />
  </authorization>
</system.web>
```
- B.

```
<system.web>
  <authentication mode="Forms">
    <forms loginUrl="login.aspx" />
  </authentication>
  <authorization>
    <deny users="*" />
  </authorization>
</system.web>
```
- C.

```
<system.web>
  <authentication mode="Windows">
  </authentication>
  <authorization>
    <deny users="?" />
  </authorization>
```

```
</system.web>  
D. <system.web>  
  <authentication mode="Windows">  
  </authentication>  
  <authorization>  
    <deny users="*" />  
  </authorization>  
</system.web>
```

Answer: A

Question: 3

You create a Microsoft ASP.NET Web application by using the Microsoft .NET Framework version 3.5. The computer that hosts the ASP.NET Web application contains a local instance of Microsoft SQL Server 2005. The instance uses Windows Authentication. You plan to configure the membership providers and the role management providers. You need to install the database elements for both the providers on the local computer. What should you do?

- A. Run the sqlcmd.exe -S localhost E command from the command line.
- B. Run the aspnet_regiis.exe -s localhost command from the command line.
- C. Run the sqlmetal.exe /server:localhost command from the command line.
- D. Run the aspnet_regsql.exe -E -S localhost -A mr command from the command line.

Answer: D

Question: 4

You create a Microsoft ASP.NET Web application by using the Microsoft .NET Framework version 3.5. The application uses ASP.NET AJAX, and you plan to deploy it in a Web farm environment. You need to configure SessionState for the application. Which code fragment should you use?

- A. `<sessionState mode="InProc" cookieless="UseCookies" />`
- B. `<sessionState mode="InProc" cookieless="UseDeviceProfile" />`
- C. `<sessionState mode="SQLServer" cookieless="false" sqlConnectionString="Integrated Security=SSPI;data source=MySqlServer;" />`

```
D. <sessionState mode="SQLServer"
cookieless="UseUri"
sqlConnectionString="Integrated
Security=SSPI;data source=MySQLServer;"/>
```

Answer: C

Question: 5

You create a Microsoft ASP.NET application by using the Microsoft .NET Framework version 3.5. You derive a new validation control from the BaseValidator class. The validation logic for the control is implemented in the Validate method in the following manner.

```
Protected Overloads Function Validate( _
    ByVal value As String) As Boolean
    ...
End Function
```

You need to override the method that validates the value of the related control. Which override method should you use?

A. Protected Overloads Overrides Function EvaluateIsValid() As Boolean

```
Dim value As String = _
    GetControlValidationValue(Me.Attributes("AssociatedControl"))
Dim isValid As Boolean = Validate(value)
Return isValid
```

End Function

B. Protected Overloads Overrides _

```
Function ControlPropertiesValid() As Boolean
    Dim value As String = _
        GetControlValidationValue(Me.ValidationGroup)
    Dim isValid As Boolean = Validate(value)
    Return isValid
```

End Function

C. Protected Overloads Overrides Function EvaluateIsValid() As Boolean

```
Dim value As String = _
    GetControlValidationValue(Me.ControlToValidate)
Dim isValid As Boolean = Validate(value)
Return isValid
```

End Function

D. Protected Overloads Overrides Function ControlPropertiesValid() As Boolean

```
Dim value As String = _
    GetControlValidationValue(Me.Attributes("ControlToValidate"))
Dim isValid As Boolean = Validate(value)
Me.PropertiesValid = isValid
Return True
```

End Function

Answer: C

Question: 6

You create a Microsoft ASP.NET application by using the Microsoft .NET Framework version 3.5. You write the following code fragment.

```
<asp:DropDownList AutoPostBack="true"
  ID="DropDownList1" runat="server"
onselectedindexchanged=
  "DropDownList1_SelectedIndexChanged">
<asp:ListItem>1</asp:ListItem>
  <asp:ListItem>2</asp:ListItem>
<asp:ListItem>3</asp:ListItem>
</asp:DropDownList>
```

You also add a MultiView control named MultiView1 to the Web page. MultiView1 has three child View controls. You need to ensure that you can select the View controls by using the DropDownList1 DropDownList control. Which code segment should you use?

- A. Dim idx As Integer = DropDownList1.SelectedIndex
MultiView1.ActiveViewIndex = idx
- B. Dim idx As Integer = Integer.Parse(DropDownList1.SelectedValue)
MultiView1.Views(idx).Visible = True
- C. Dim idx As Integer = Integer.Parse(DropDownList1.SelectedValue)
MultiView1.ActiveViewIndex = idx
- D. Dim idx As Integer = DropDownList1.SelectedIndex
MultiView1.Views(idx).Visible = True

Answer: A

Question: 7

You create a Microsoft ASP.NET application by using the Microsoft .NET Framework version 3.5. You plan to submit text that contains HTML code to a page in the application. You need to ensure that the HTML code can be submitted successfully without affecting other applications that run on the Web server. What should you do?

- A. Add the following attribute to the @Page directive.
EnableEventValidation="true"
- B. Add the following attribute to the @Page directive.
ValidateRequest="true"
- C. Set the following value in the Web.config file.
<system.web>
<pages validateRequest="false"/>
</system.web>
- D. Set the following value in the Machine.config file.
<system.web>

```
<pages validateRequest="false"/>
</system.web>
```

Answer: C

Question: 8

You create a Microsoft ASP.NET application by using the Microsoft .NET Framework version 3.5. You create a custom control named OrderForm.

You write the following code segment.

```
Public Delegate Sub _
CheckOrderFormEventHandler(ByVal e As EventArgs)
Private Shared ReadOnly CheckOrderFormKey As New Object()
public event CheckOrderFormEventHandler
Public Custom Event CheckOrderForm As CheckOrderFormEventHandler
  AddHandler(ByVal value As CheckOrderFormEventHandler)
    Events.[AddHandler](CheckOrderFormKey, value)
  End AddHandler
  RemoveHandler(ByVal value As CheckOrderFormEventHandler)
    Events.[RemoveHandler](CheckOrderFormKey, value)
  End RemoveHandler
  RaiseEvent(ByVal e As EventArgs)
  End RaiseEvent
End Event
```

You need to provide a method that enables the OrderForm control to raise the CheckOrderForm event. Which code segment should you use?

- A. Protected Overridable Sub _
OnCheckOrderForm(ByVal e As EventArgs)
Dim checkOrderForm As CheckOrderFormEventHandler = _
DirectCast(Events(GetType(CheckOrderFormEventHandler)), _
CheckOrderFormEventHandler)
RaiseEvent CheckOrderForm(e)
End Sub
- B. Protected Overridable Sub _
OnCheckOrderForm(ByVal e As EventArgs)
Dim checkOrderForm As CheckOrderFormEventHandler = _
TryCast(Events(CheckOrderFormKey), _
CheckOrderFormEventHandler)
RaiseEvent CheckOrderForm(e)
End Sub
- C. Private checkOrderForm As New _
CheckOrderFormEventHandler(AddressOf _
checkOrderFormCallback)
Protected Overridable Sub _
OnCheckOrderForm(ByVal e As EventArgs)
If checkOrderForm IsNot Nothing Then
checkOrderForm(e)

```
End If
End Sub
D. Private checkOrderForm As New _
    CheckOrderFormEventHandler(AddressOf _
        checkOrderFormCallBack)
Protected Overridable Sub _
    OnCheckOrderForm(ByVal e As EventArgs)
    If checkOrderForm IsNot Nothing Then
        RaiseBubbleEvent(checkOrderForm, e)
    End If
End Sub
```

Answer: B

Question: 9

You create a Microsoft ASP.NET application by using the Microsoft .NET Framework version 3.5. You create a Web form and add the following code fragment.

```
<asp:Repeater ID="rptData" runat="server"
DataSourceID="SqlDataSource1"
    ItemDataBound="rptData_ItemDataBound">
    <ItemTemplate>
        <asp:Label ID="lblQuantity" runat="server"
            Text='<%# Eval("QuantityOnHand") %>' />
        </ItemTemplate>
    </asp:Repeater>
```

The SqlDataSource1 DataSource control retrieves the Quantity column values from a table named Products. You write the following code segment to create the rptData_ItemDataBound event handler. (Line numbers are included for reference only.)

```
01 Protected Sub rptData_ItemDataBound(ByVal sender As Object, _
02 ByVal e As RepeaterItemEventArgs)
03
04 If lbl IsNot Nothing Then
05 If Integer.Parse(lbl.Text) < 10 Then
06 lbl.ForeColor = Color.Red
07 End If
08 End If
09 End Sub
```

You need to retrieve a reference to the lblQuantity Label control into a variable named lbl. Which code segment should you insert at line 03?

- A. Dim lbl As Label = _
TryCast(Page.FindControl("lblQuantity"), Label)
- B. Dim lbl As Label = _
TryCast(e.Item.FindControl("lblQuantity"), Label)
- C. Dim lbl As Label = _
TryCast(rptData.FindControl("lblQuantity"), Label)
- D. Dim lbl As Label = _

TryCast(e.Item.Parent.FindControl("lblQuantity"), Label)

Answer: B

Question: 10

You create a Microsoft ASP.NET application by using the Microsoft .NET Framework version 3.5. You create a composite custom control named MyControl. You need to add an instance of the OrderFormData control to the MyControl control. Which code segment should you use?

- A. Protected Overloads Overrides Sub _
CreateChildControls()
Controls.Clear()
Dim oFData As New OrderFormData("OrderForm")
Controls.Add(oFData)
End Sub
- B. Protected Overloads Overrides Sub _
RenderContents(ByVal writer As HtmlTextWriter)
Dim oFData As New OrderFormData("OrderForm")
oFData.RenderControl(writer)
End Sub
- C. Protected Overloads Overrides Sub _
EnsureChildControls()
Controls.Clear()
Dim oFData As New OrderFormData("OrderForm")
oFData.EnsureChildControls()
If Not ChildControlsCreated Then
CreateChildControls()
End If
End Sub
- D. Protected Overloads Overrides Function _
CreateControlCollection() As ControlCollection
Dim controls As New ControlCollection(Me)
Dim oFData As New OrderFormData("OrderForm")
controls.Add(oFData)
Return controls
End Function

Answer: A

Question: 11

You create a Microsoft ASP.NET application by using the Microsoft .NET Framework version 3.5. You write the following code fragment.

```
<asp:ListBox SelectionMode="Multiple"
  ID="ListBox1" runat="server">
</asp:ListBox>
<asp:ListBox ID="ListBox2" runat="server">
</asp:ListBox>
<asp:Button ID="Button1" runat="server"
  Text="Button" onclick="Button1_Click" />
```

You need to ensure that when you click the Button1 control, a selected list of items move from the ListBox1 control to the ListBox2 control. Which code segment should you use?

- A. For Each li As ListItem In ListBox1.Items
 If li.Selected Then
 ListBox2.Items.Add(li)
 ListBox1.Items.Remove(li)
 End If
Next
- B. For Each li As ListItem In ListBox1.Items
 If li.Selected Then
 li.Selected = False
 ListBox2.Items.Add(li)
 End If
Next
For Each li As ListItem In ListBox2.Items
 If ListBox1.Items.Contains(li) Then
 ListBox1.Items.Remove(li)
 End If
Next
- C. For Each li As ListItem In ListBox1.Items
 If li.Selected Then
 li.Selected = False
 ListBox2.Items.Add(li)
 End If
Next
For Each li As ListItem In ListBox1.Items
 If ListBox2.Items.Contains(li) Then
 ListBox1.Items.Remove(li)
 End If
Next
- D. For Each li As ListItem In ListBox1.Items
 If li.Selected Then
 li.Selected = False
 ListBox2.Items.Add(li)
 ListBox1.Items.Remove(li)
 End If
Next

Answer: D

Question: 12

You create a Microsoft ASP.NET application by using the Microsoft .NET Framework version 3.5. You create two user controls named UserCtrlA.ascx and UserCtrlB.ascx. The user controls postback to the server. You create a new Web page that has the following ASPX code.

```
<asp:CheckBox ID="Chk" runat="server"
oncheckedchanged="Chk_CheckedChanged" AutoPostBack="true" />
<asp:Placeholder ID="PIHolder" runat="server"></asp:Placeholder>
```

To dynamically create the user controls, you write the following code segment for the Web page.

```
Public Sub LoadControls()
    If ViewState("CtrlA") IsNot Nothing Then
        Dim c As Control
        If CBool(ViewState("CtrlA")) = True Then
            c = LoadControl("UserCtrlA.ascx")
        Else
            c = LoadControl("UserCtrlB.ascx")
        End If
        c.ID = "Ctrl"
        PIHolder.Controls.Add(c)
    End If
End Sub
Protected Sub Chk_CheckedChanged(ByVal sender As Object, _
ByVal e As EventArgs)
    ViewState("CtrlA") = Chk.Checked
    PIHolder.Controls.Clear()
    LoadControls()
End Sub
```

You need to ensure that the user control that is displayed meets the following requirements:

- It is recreated during postback
- It retains its state.

Which method should you add to the Web page?

- A. Protected Overloads Overrides Function _
SaveViewState() As Object
LoadControls()
Return MyBase.SaveViewState()
End Function
- B. Protected Overloads Overrides _
Sub Render(ByVal writer As HtmlTextWriter)
LoadControls()
MyBase.Render(writer)
End Sub
- C. Protected Overloads Overrides Sub _
OnLoadComplete(ByVal e As EventArgs)
MyBase.OnLoadComplete(e)
LoadControls()
End Sub

```
D. Protected Overloads Overrides Sub _  
LoadViewState(ByVal savedState As Object)  
MyBase.LoadViewState(savedState)  
LoadControls()  
End Sub
```

Answer: D
